Ticket	Message	Label	Priority (reason in each ticket below)
RES-2984	How do i create an email?	Outbound email	5
RES-1927	I'm not sure how to add the TXT record at Vercel. Can you tell me how?	Domain verification sub label: Dkim	7
RES-5842	I need to be able to receive emails from Resend. How do I do that?	Inbound email	6
RES-7921	My emails suddenly stopped sending last night for 4 hours and thousands of magic links didn't send. What happened? This is unacceptable.	Sending Issues Sub label: Suspension	1
RES-3485	When I send a request to trigger a notification, I get an error message in the system. The user does not receive the email, and the system displays an error message: "Too many requests. You can only make 2 requests per second. See rate limit response headers for more information. Or contact support to increase rate limit."	API Issue Sub label: Rate limit	3
RES-2196	My emails are going to the spam folder at Gmail. What can I do to stop this?	Deliverability Sub label: Delivery issue	4
RES-1348	I'm seeing a ton of 403 errors on my account. How do I fix that?	API issue Sub label: API Troubleshooting	2

Ticket	Message	Label	Priority 5
RES-2984	How do i create an email?	Outbound email	The request indicates this is a completely new customer, this means that they are just getting started with the app and have pretty much not used it at all. It is important to make them feel welcome that we are here to help then with any guidance they need. I am putting this one above the other customers because even though the other ones also seem to be new, it seems like they have already been playing a little with the platform since they are already in the step of verifying the domain. This client is also asking for help in the basic use of the platform that might be a little more complicated to guide (coding and API) than the txt record client.

Investigation:

This is an ambiguous request so it is difficult to provide an actual solution that fits the customer needs without asking for more details. To me, this could be related either to send emails using the platform or how to create a template for sending emails. In this scenario I would ask for clarification and also provide really basic details for both of the possible scenarios with links to our documentation on each.

Response:

Hello there,

I hope you are great!

Thanks for reaching out. My name is Andres and I will be more than happy to help you. In order to provide the best guidance I would like to clarify what you mean by "create an email". Are you referring on how to send an email using Resend and connecting the platform to your app or are you referring to how to create a template and use it to send an email?

If you are referring to sending the email, this would really depend on the coding language you are using, you can find the quickstart for every single one we support here: <https://resend.com/docs/introduction>.

Pretty much the path is: Create account → Generate API key → Verify domain → Install SDK → Configure API key → Call `emails.send()` → Monitor delivery.

If you are referring to creating a template, you can learn more about that here: <https://resend.com/docs/dashboard/templates/introduction>. The flow would be: Create template → Add variables → Render template → Pass HTML to Resend → Send email

If you any specific questions I will be more than happy to help you. I hope you have a great day!:))

Ticket	Message	Label	Priority: 7
RES-1927	I'm not sure how to add the TXT record at Vercel. Can you tell me how?	Domain verification sub label: Dkim	This is a education ticket so, even though it is important for the client to verify the domain to be able to send emails with their account, this is not a high priority in comparison of the other tickets. Since the txt record have not been verified this mostly indicates they are a new client so they are just getting started and will probably not be a high ARR customer. If they do not know how to do it means that this might be their 1st domain so they are adding so they have not started using the platform yet. Also, they do not seem to be rushed based on the tone they are using in this request.

Investigation:

Investigate the Resend documentation to confirm if there is a direct guide that we can share with this customer. If not, investigate with different tools like Youtube, Vercel documentation and AI to put together the instructions on how to verify the TXT records in Vercel.

In this case we have a direct guide so I will share that documentation with the customer and even though they ask how to add the TXT record, they might not be aware of Resend's Automatic setup.

Response:

Hello there,

I hope you are great!

Thanks for reaching out. My name is Andres and I will be more than happy to help you. We have two ways of verifying the txt record with Vercel.

The first one is our recommended automatic set up which is the fastest way to verify your domain on Vercel is using the Auto Configure button on Resend. This uses Domain Connect to automatically configure your DNS records. You can find the steps in this direct link:

<https://resend.com/docs/knowledge-base/vercel#automatic-setup-recommended>

The second option is to do it manually. You can add the TXT record directly from your Vercel DNS settings. You can add both SPF and DKIM txt records, If you prefer to do it this way the steps are described in this other link:

<https://resend.com/docs/knowledge-base/vercel#add-txt-spf-record>

If you any specific questions I will be more than happy to help you. I hope you have a great day!:))

Ticket	Message	Label	Priority: 6
RES-5842	I need to be able to receive emails from Resend. How do I do that?	Inbound email	This one is also an educational ticket, it is still important to guide our client however this does not seem to be urgent since this is the first time they are doing this. However since they are looking to receive emails, that indicates they might already use the account for outbound and this be a new feature that they have to implement in their process. This could even be a high ARR client that is looking to use the feature

Investigation:

First of all, I would confirm with the client if they are actually looking for inbound messages or if they need help with any other request since this is a little ambiguous as well. I would also share inbound details in case this is what they are referring to and avoid some possible back and forth with the customer.

Response:

Hello there,

I hope you are great!

Thanks for reaching out. My name is Andres and I will be more than happy to help you. In order to provide the best guidance I would like to clarify what you mean by “receive emails from Resend”. Are you referring to receiving inbound messages in your Resend account?

If that is the case we have a great guide on how to set inbound messages in the platform. You can find the guide here, it includes videos, and a step by step guide on how to set it up: <https://resend.com/blog/inbound-emails>

If you are not referring to inbound messages please provide more details on what you need and I will be happy to guide you.

I hope you have a great day!:))

Ticket	Message	Label	Priority: 1
RES-7921	My emails suddenly stopped sending last night for 4 hours and thousands of magic links didn't send. What happened? This is unacceptable.	Sending Issues Sub label: Suspension	The customer mentioned there are thousands of messages that were not sent for 4 hours. This could have included OTP, password resets or account confirmation emails which are time sensitive most of the time. Not being able to send emails for 4 hours is a huge issue specially if this is affecting a high ARR customer since it affects the company's reputation, credibility and it might affect the trust the client has put in us. According to the request the emails seem to be sending now but there are thousands of emails that were lost and this has to be investigated as soon as possible

Investigation:

I would first of all review the account and verify if it was suspended, if it is I would check the reason why and explain this to the customer. By doing an investigation I found out that emails are not automatically queued while an account is paused. Any send attempts made during the pause period will need to be retried after the account is re-enabled. This could explain why all the messages were not sent.

If I do not see a suppression I would ask the client if they noticed any error messages when trying to send those messages that could guide us on the right direction for this issue and troubleshoot accordingly

Response:

Hello there,

I hope you are great!

Thanks for reaching out. My name is Andres and I will be more than happy to help you. I definitely understand the impact that might have had in your business. While we investigate the reason of this issue I would like to know if you noticed any kind of errors that might showed up when you were trying to send messages during those 4 hours.

If you did not receive any error messages but did received 200 codes or successful messages could you share 2 or 3 examples of messages IDs so we can review them internally. Also, I would like to know if you use API or SMTP to send those messages as well. With this information we will be able to investigate and get back to you as soon as possible.

If you have any other questions I will be happy to help. I hope you have a great day!:))

Escalation:

Note: For this escalation I will consider that the account is not suspended, they did not receive any error messages, and are able to provide 2 messages IDs that are not present in the dashboard and were not received by a client.

Main Issue:

Hello team, the customer reports that emails unexpectedly stopped sending for approximately 4 hours, resulting in thousands of missing magic link emails. The account was not suspended, no API errors or error messages were reported, and the customer was able to continue making send attempts during the affected period. However, some messages appear to be missing entirely from the Resend dashboard and were not delivered to recipients.

Investigation Details:

- We are not able to reproduce right now since the emails are now being sent normally. However the customer provided some messages IDs they got when completing the

request. Could you please verify internally whether the provided message IDs exist in Resend systems:

- Message ID: 7f8e9d10-1234-5678-abcd-987654321000
- Message ID: 7f8e9d10-1234-5678-abcd-965849383955

Their account username is : customer1234

Please confirm whether these messages were received by the sending pipeline, accepted for processing, or dropped before appearing in the dashboard. At the moment we have not received any similar requests from different customers so it seems like this is not a trending issue. They are using API, this is the full call they used to send those messages:

```
curl -X POST 'https://api.resend.com/emails' \  
-H 'Authorization: Bearer re_123456789abcdef' \  
-H 'Content-Type: application/json' \  
-d '{  
  "from": "no-reply@example.com",  
  "to": ["user@example.com"],  
  "subject": "Your Magic Link",  
  "html": "<p>Click the link below to sign in:</p><a  
href=\"https://example.com/auth/magic-link?token=abc123\">Sign in</a>"  
}'
```

They got the following response:

```
{  
  "id": "7f8e9d10-1234-5678-abcd-987654321000"  
}
```

Impact / Urgency:

This issue is high priority because it affected a critical transactional email flow (magic links), potentially preventing thousands of end users from authenticating or accessing their accounts. The customer did not receive any visible errors, making the issue difficult to detect and troubleshoot from their side. If messages are accepted by the API but do not enter the sending pipeline or appear in the dashboard, this could indicate a reliability issue affecting customer trust and critical production workflows.

I am looking forward to your response. Thank you!

Ticket	Message	Label	Priority: 3
RES-3485	When I send a request to trigger a notification, I get an error message in the system. The user does not receive the email, and the system displays an error message: "Too many requests. You can only make 2 requests per second. See rate limit response headers for more information. Or contact support to increase rate limit."	API Issue Sub label: Rate limit	I consider this a high priority ticket because it is not allowing the customers to send emails do to a 429 error message. This is related to the rate limit which is more educational than an issue itself but they are already a sending customer and could be a high ARR since they could be sending more than they usually do.

Investigation:

In this one it seems like they get a 429 error based on the documentation https://resend.com/docs/api-reference/errors#rate_limit_exceeded. For this one I will assume the error is correct however I noticed that the documentation indicates that the limit is 10 requests per second. I will educate the customer and provide some alternate solutions.

Response:

Hello there,

I hope you are great!

Thanks for reaching out. My name is Andres and I will be more than happy to help you.

The error you're seeing indicates that your account is hitting the API rate limit and the requests are being rejected with a 429 (Rate Limit Exceeded) response.

The default maximum rate limit is 2 requests per second per team. This limit applies across all API keys associated with your team. Once this limit is exceeded, the API returns a 429 response and the email request is not processed.

You can also review any rate-limited requests by filtering for 429 on the Resend Logs page: <https://resend.com/settings/usage>

To prevent this from happening, we recommend reducing the rate at which your application sends requests. This can be accomplished by introducing a queue to spread requests over time or reducing the number of concurrent requests sent per second.

If your use case legitimately requires a higher throughput, we'd be happy to review an increase to your rate limit. Please provide some additional details about your sending pattern, such as:

- Your expected requests per second.
- Whether the traffic is sustained or occurs in short bursts.
- A brief description of your use case.

With that information, we can evaluate whether a rate limit increase would be appropriate. You can find more details here: <https://resend.com/docs/api-reference/rate-limit>

If you any specific questions I will be more than happy to help you. I hope you have a great day!:)

Ticket	Message	Label	Priority:
RES-2196	My emails are going to the spam folder at Gmail. What can I do to stop this?	Deliverability Sub label: Delivery issue	I give this a 4 priority because I consider deliverability is one of the most important aspects of the platform and a big reason why they choose resend over other email services. In this case I did not put it higher because the client mentioned that the issue is happening specifically in Gmail and Gmail is one of the emails providers that have really strict rules.

			This does not necessarily mean that there is an issue with our reputation or IPs, a lot of things could make the emails to land in spam in Gmail like if they do not have a plain text, if they do not have a footer, also their domain reputation, etc So it is safe to say that we are not able to confirm this is our fault before an investigation
--	--	--	--

Investigation:

This is a deliverability issue, it is important to know that once the email is out of Resend, we are not able to control where the email will land. We should make sure that the customers are following as many best practices as possible. Email providers like Gmail, Yahoo and Microsoft are well known for having strict rules and even a small failure could cause the email to land in spam. I would definitely make sure that the domain is fully verified since this has been required by Gmail since 2024.

Some other things that could affect this are the domain age and reputation, the volume of email they send, the content of the email including a missing footer, links in the subject, a plain text version missing, etc.

There is an investigation that has to be started on email examples so I would start by asking them 2 email examples so we can review them and if possible, ask for an example that was placed in the inbox so we can compare both. I would also make sure to let them know they should follow as many best practices as possible.

Response:

Hello there,

I hope you are great!

Thanks for reaching out. My name is Andres and I will be more than happy to help you. I understand you are experiencing issues with your email placement in Gmail. First of all I would like to clarify that public email services such as Gmail, Yahoo and Microsoft have really strict rules that could affect the inbox placement by a single best practice you might fail.

In order to investigate why this could be happening, could you please provide 2 or 3 examples of emails that landed in the spam folder? If possible please also share an email

that landed in the inbox correctly so we can compare them and see if there are any differences that could have caused them to not be moved to the inbox as well.

I would also recommend taking a look at this guide we have created with the top 10 deliverability tips. Most of the times by following these tips you should be able to make your emails land in the inbox correctly. You can find them here:

<https://resend.com/blog/top-10-email-deliverability-tips>

Some other recommendations you can ask your client to do is to add your from email address to the contact in their Gmail account so it marks it as safe and check their email rules to make sure they are not blocking any emails that might be coming from you.

I am looking forward to your response. If you any specific questions I will be more than happy to help you. I hope you have a great day!:)

Ticket	Message	Label	Priority: 2
RES-1348	I'm seeing a ton of 403 errors on my account. How do I fix that?	API issue Sub label: API Troubleshooting	I chose to put this as the second priority because the customer indicated they are seeing a ton of emails with this 403 error. Due to this the emails they are trying to send are not being delivered and those could include OTP email, password resets and account logins. They have clearly been using the platform already since they are sending enough volume for this to worry them and that experience could make the churn and move to a different platform.

Investigation:

A 403 error indicated an invalid action on the customer's side. This will most likely be a educational case however we still have to make some troubleshooting to make sure this is not an issue happening on our end. We first need to ask them for the full error messages since there are 4 possibilities within Resend that could cause 403 errors (domain not verified, domain has been created already, invalid API key and they try to send emails to other users without verifying the domain)

In order to provide an accurate answer I will ask them the full error message they get and confirm if it is the same one for every single time they try to send a message. Based on the one they receive we, we can work on a solution or guidance with them

Response:

Hello there,

I hope you are great!

Thanks for reaching out. My name is Andres and I will be more than happy to help you. I understand you are experiencing 403 errors when trying to send emails. In order to better investigate the issue for you, could you please share the full error message you get and the full API call you are using?

A 403 errors could be present for different reasons and depending on which one you get the process could be different. Also, could you confirm if you are receiving the same one every single time or is it a combination of different error descriptions? You can find all the possible reasons for this error here with a suggested solution as well:

https://resend.com/docs/api-reference/errors#invalid_api_key

I am looking forward to your response so we can continue assisting you with this request.

If you have any specific questions I will be more than happy to help you. I hope you have a great day!:)
